

DSA Commercial Scheduling MVP1

Stakeholder Manual

This PDF carries the narrative that was intentionally removed from the hosted demo. The Netlify view should stay focused on the wizard and decision console.

Blueprint Anchor

MVP1 is a Commercial Persona workflow for "Just Say Yes" / "In The Know." It begins with SFDC intake, uses Opportunity Start Date as the mandatory gate date, checks whether the target start is more than four months out, asks for missing configuration data, calculates site/month options, and gives Commercial a green light or an off-ramp.

Do not change the scope: MVP1 does not reserve capacity, optimize room-level schedules, replace Central Scheduling, or create a final operational execution date.

Latest VoC Synthesis

- Snapshot, not promise: PowerBI/RACE timing is useful, but perishable. Commercial needs validity language: eligible to propose, not reserved, recheck required after expiry or scope change.
- Date semantics are risky: requested start can mean in vivo start, LabSci method start, test material availability, or customer submission timing.
- RFP already has data: preferred site, triage site, requested start, management triage release, test material, LabSci triage, study design, and comments.
- Budgetary is different: budgetary estimates can tolerate quarter or broad timing; ready-to-execute and specific-date requests require stricter checks.
- Site flexibility is leverage: a broader region or any qualified site can unlock earlier month options.
- Free text still matters: email, Teams, notes, and description fields hold constraints that rules may not parse.

Current-State Observations

- The Opportunity page is the commercial home base: stages, studies, RFP, files/SOW, Proposal Builder, notes, award, and health check.
- The Study detail page already contains Scheduling Status values such as Timing Requested, Escalate Capabilities, Escalate Timing, Confirmed, Scheduling Expired, Requested Month Of, Confirmed Month Of, and Placeholder states.
- Those status values are useful, but they mix recommendation state, timing precision, validity, off-ramp reason, and commitment level.
- The Configurator and Study Support Component View contain rich operational signals, but MVP1 should use them to qualify and caveat Commercial recommendations, not automate micro-scheduling.

Screenshots are not embedded in the public deployable package because they include current SFDC context and customer/opportunity examples. They were used as design reference only.

Recommended Field Model

Split the current Scheduling Status concept into clearer MVP1 states.

Current mixed concept	MVP1 model
Not Confirmed / Confirmed	Recommendation state
Requested Month Of / Confirmed Month Of	Timing precision and commitment level
Scheduling Expired	Validity state
Escalate Timing / Escalate Capabilities	Central Scheduling off-ramp reason
Placeholder	Date-source confidence and commitment level

Stakeholder-Safe Product Line

The Configurator and SFDC/RFP data give us enough structured study context to improve Commercial scheduling confidence. MVP1 should use that context to qualify, recommend, caveat, and escalate. It should not reserve capacity or override Scheduling judgment.

Demo Boundary

- Hosted demo: wizard plus decision console only.
- Top state tabs are connected to the actual wizard evaluation state.
- Snapshot recommendations are selectable as UI state only.
- Side reading: this PDF.
